

Next.js is an extension of **React** that incorporates pre-built solutions, ready to use features, additional functionalities.

Guillermo Rauch is known for creating Next.js and Socket.io.

Framework

A Framework is a structured tool with predefined rules and conventions that dictates an application's architecture, design patterns, and workflows.

Its main benefit is providing pre-built solutions for common tasks (e.g., Database integration, Managing routing, Authentication), allowing developers to focus on application logic.

NextJS provides built-in features like

1. Server-Side Rendering (SSR) and Static Site Generation (SSG)
2. Improved SEO
3. Automatic Code Splitting

React JS renders everything on the Client Side sending a minimal HTML from the server. Server sends a minimal HTML & huge JS file to the Client side & then the browser executes them to generate a HTML file. This creates a huge challenge to the search engine crawlers to access & understand the complete content of the page.

On the other hand NextJS Provides Static Site Generation or Server Side Rendering. Server sends a complete HTML & minimal JS code to the Client side to render only the content required in the client side interaction. This way the search engine crawlers to access & understand the complete content of the page easily.

- Seamless file-based Routing
- Efficient Code Splitting
- Image & Font Optimization
- Hot Module Replacement
- API Routes (Backend)
- Built in support for SAAS
- CSS Modules
- Data Fetching Choice
- Error Handling
- Metadata API (For SEO)
- Internationalization (support for any spoken language)
